ABSTRACT

This project focuses on building a web-based platform to automate the resume screening process for recruiters and HR professionals. The system allows users to upload resumes in formats like PDF, DOCX, and TXT, and applies smart filters based on criteria such as skills, education, experience, and location. By extracting and organizing key information from resumes, it aims to reduce manual effort and improve the efficiency and accuracy of candidate selection.

The platform uses Python for backend development and integrates a custom AI module for intelligent resume analysis, ranking, and scoring. It processes uploaded resumes, extracts relevant data, and generates a ranked list of candidates based on recruiter preferences. This approach ensures faster and more effective hiring by helping recruiters quickly identify the best-fit candidates.
