ABSTRACT

The **Employee Management System** is a web-based application developed to streamline and manage employee data efficiently. This system is designed using HTML and CSS for the frontend interface, offering a clean and user-friendly design. The backend is powered by Java Servlets and JDBC, facilitating seamless interaction with a SQL database for data storage and retrieval. The current implementation focuses solely on the **user module**, allowing basic functionalities such as employee registration, login, profile viewing, and updating personal information. The application ensures real-time data handling and smooth communication between the frontend and backend layers, ensuring data integrity and consistency. This project focuses exclusively on the **user module**, which encompasses several essential functionalities for individual employees. These include **user registration**, **secure login authentication**, **profile viewing**, and **updating of personal details** such as contact information, department, and job title. Form validation is implemented at both client-side (using HTML5 validation attributes) and server-side (within Java Servlets) to ensure data accuracy and prevent malformed input.
