ABSTRACT

The Railway Management System is a modern computer application created to help improve how railway operations are handled. This project mainly focuses on automating important tasks like ticket booking, train schedule updates, storing passenger details, and supporting staff in managing the system.

Many railway tasks are still done by hand, which can cause delays and mistakes. This system reduces the need for manual work, makes data more accurate, and gives users a better experience. It has features for booking or cancelling tickets, checking train availability, and managing train routes and staff records.

The system also protects users' information, is easy to use, and works in real-time. It is built using common web development tools and a database to store all information. This Railway Management System can grow and change depending on the future needs of the railway service.
