ABSTRACT

The Password Generator System is a web-based application designed to help users create strong, secure, and random passwords. This platform aims to improve online security by offering an easy-to-use tool for generating passwords that meet modern security standards. The system allows users to customize their password strength and complexity, ensuring that passwords are difficult to guess or crack.

The system is built using HTML, CSS, Java, and SQL, and features a user-friendly interface that enables users to generate passwords based on various criteria, such as length, inclusion of special characters, numbers, and uppercase letters. Users can adjust settings to create passwords that are secure and tailored to their needs. The application also provides a preview of the generated password, ensuring that it meets the user's requirements before finalizing it.
