ABSTRACT

The Weather App is a web-based application that provides users with real-time weather updates for cities worldwide. By leveraging the Open Weather Map API, the app allows users to search for weather conditions in any location, displaying essential details such as temperature, humidity, wind speed, and weather description (e.g., sunny, rainy). It also features dynamic icons that visually represent different weather conditions, enhancing the user experience.

Built using HTM-, CSS, and JavaScript, the app is designed to be responsive, ensuring it functions smoothly on various devices and screen sizes. The app fetches weather data asynchronously using the Fetch APl, ensuring a seamless experience without page reloads. Users can easily search for different cities and view the weather in either Celsius or Fahrenheit, depending on their preference.
The app includes robust error handling, providing informative messages when an invalid city is entered or when there is an issue with fetching data from the API. This ensures that users are always given clear feedback.

Overall, the Weather App demonstrates key concepts of web development, including API integration, asynchronous programming, and responsive design. It serves as an efficient, user-friendly tool for anyone seeking quick and accurate weather information.
