ABSTRACT

AnyShare is a lightweight and efficient web-based file sharing platform designed to simplify the process of transferring files between users. The system enables users to upload a file, after which a unique code is generated and stored along with the file link in a secure MongoDB database. This code acts as a key for the receiver to access and download the corresponding file.

The application leverages cloud storage via Cloudinary to manage uploaded files and ensures data persistence using MongoDB. It eliminates the need for user registration or email-based sharing, streamlining the entire process into a fast, secure, and code-driven interaction.

AnyShare is ideal for users who seek a hassle-free and intuitive method of sending files without depending on traditional file transfer services. Its simple interface and efficient backend design make it suitable for personal, academic, or small-team professional use cases.
